ABSTRACT

Examined are the educational and employment characteristics of scientists and engineers who graduated during the years 1972, 1974, 1975, and 1976, with special attention to those whose work involves energy. The characteristics of energy-related graduates to those of more experienced scientists and engineers involved in energy activities are compared. Presented for the first time are tabulations on employment involving specific energy sources and activities. Other characteristics discussed include educational level, salary, primary work activity, type of employer, and the proportion of graduates who found employment in their major fields. Data are from the 1976 and 1978 National Surveys of Recent Science and Engineering Graduates, and the 1976 National Survey of Natural and Social Scientists and Engineers, sponsored by the National Science Foundation and the U.S. Department of Energy. FOREWORD

This report examines the educational and employment characteristics of scientists and engineers who graduated during the years 1972, 1974, 1975, and 1976, with special attention to those whose work includes energy. The characteristics of energy-related graduates are also compared to those of more experienced scientists and engineers involved in energy producties. Information is based on the results of the 1976 and 1978 National National Science and Engineering Graduates, and the 1976 National Science Foundation and the U.S. Department of Energy.

Tabulations are included for the first time on employment involving specific energy sources and activities. Other characteristics discussed include educational level, salary, primary work activity, type of employer, and the proportion of graduates who found employment in their major field.

Norman Seltzer, Chief Manpower Assessment Office of Education, Business and Labor Affairs

55	Primary Work Activity of Scientists: Energy-Related Recent Graduates Versus Energy-Related Experienced Workers	75

INTRODUCTION

In recent years, national attention has increasingly focused on energy-where to get it and how best to use it. Current concerns include developing new supplies of conventional energy, developing alternative sources of energy, and conserving the energy supplies now available. The need for people with appropriate skills to perform the tasks associated with these problem areas has drawn attention to education, training, and employment in energy-related activities. This report examines the characteristics of scientists and engineers who graduated during the years 1972, 1974, 1975, and 1976, with special attention to those whose work involves energy. The information is based on the results of the 1976 and 1978 National Survey of Recent Science and Engineering Graduates, sponsored by the National Science Foundation (NSF). The 1978 survey, for the first time, included questions on employment in specific types of energy fields and activities. The sample size was also enlarged in the second survey to include more energy-related graduates. Funds for these changes were provided by the Division of Labor Affairs and Manpower Assessment, the United States Department of Energy (DOE).

DATA DESCRIPTION

The first two sections of this report present data from the 1978 National Survey of Recent Science and Engineering Graduates, conducted by Westat, Inc. for the National Science Foundation and the U.S. Department of Energy. Westat surveyed 14,439 science and engineering graduates; 6,529 earned a bachelor's or master's degree between July 1, 1971 and June 30, 1972 (1972 graduates); and 7,910 received a bachelor's or master's degree between July 1, 1975 and June 30, 1976 (1976 graduates). Responses from these individuals were weighted to represent a total of 376,000 1972 graduates, and 377,000 1976 graduates. A copy of the questionnaire can be found in Appendix B.

The third section of this report compares the results of the 1976 and 1978 National Survey of Recent Science and Engineering Graduates. The shorter 1976 survey included 9,812 persons who received a bachelor's or master's degree in science or engineering between July 1, 1973 and June 30, 1975. Appendix C contains a copy of this questionnaire.

Data from the 1976 National Survey of Natural Social Scientists and Engineers (Appendix D), conducted for NSF by the Bureau of the Census, are compared with the recent graduates survey data in a fourth section.² The sample for this survey was drawn from persons who were identified as scientists and engineers in the work force during the 1970 Census of Population. Although there are differences between this and the Westat surveys,³ some of the results can be compared.

DEFINING ENERGY-RELATED SCIENTISTS AND ENGINEERS

One of the questions in the 1978 Westat surveys asked respondents to check the area of critical national interest (if any) to which they devoted a significant proportion of professional time. The question is reproduced in Figure 1. Those who answered this question by checking "energy and fuel" are considered here to be energy-related. Note that the question allows only one choice. Persons working on the environmental or health effects of energy use may have chosen "health" or "environmental protection, pollution control" instead of "energy and fuel." Persons who selected "energy and fuel" may be considered a core group of energy-related workers; the total number of persons whose work involves some aspect of energy is probably much larger.

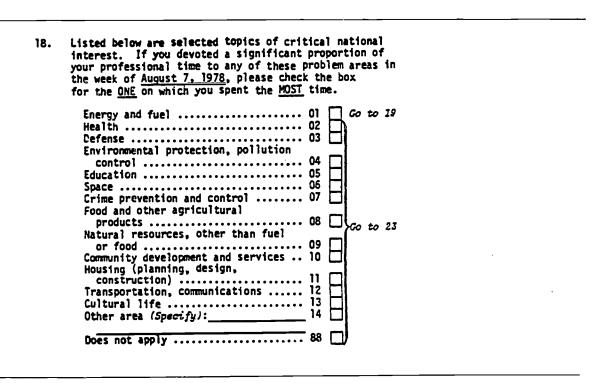

Figure 1. Question Used to Identify Energy-Related Scientists and Engineers

The question used in the 1976 National Survey of Natural and Social Scientists and Engineers differed slightly from the question in Figure 1. The Census question did not require that the choice be based on a specific reference week and did not include the choices of "transportation" or "other." Consequently, one would expect a slightly higher proportion of respondents to be represented in each category of the Census survey than in the Westat survey. The reader should remember this when comparing results from the two surveys.

The question in the 1976 Westat survey also differed slightly from that of 1978. ("Cultural life" was not a choice in 1976, and "education" represented two choices--"teaching" and "other" in that year.) However, these changes should not have made a significant difference in the number of graduates choosing "energy and fuel."

ENERGY-RELATED SCIENTISTS AND ENGINEERS

Recent graduates in science and engineering may be categorized either by employment specialty or by major field of study for the highest degree held. In general, information is given here for both major field of study and occupation, though where more appropriate, only one characterization is used.

Only 1.9 percent and 3.3 percent, respectively, of the 1972 and 1976 graduates indicated that they were unemployed and seeking work. Since the statistics for the employed respondents closely parallel those for the entire sample, the tables in this report represent only employed recent graduates.

MAJOR FIELD OF STUDY

Of the 336,000 employed 1972 graduates in engineering and science, about 7.0 percent indicated that they devoted a significant portion of their professional time to energy-related work during the reference week of August 7, 1978; approximately 8.3 percent of the 316,000 employed 1976 respondents indicated that their work was energy-related. A relatively high proportion of engineers (19.3 percent of the 1972 graduates and 22.1 percent of the 1976 graduates) were involved in energy-related activities. Only 4.0 percent and 5.0 percent, respectively, of the 1972 and 1976 graduates in science indicated energy-relatedness. However, both physical and environmental scientists were significantly involved in energy-related work (Tables 1 and 2).

OCCUPATION

The distribution of energy-related scientists and engineers by occupation is similar to the distribution of energy-related graduates by major field of study. The respondents were asked to define their occupations in terms of the field of their college major. One-third or more of those working in chemical or mechanical engineering and in environmental science, were also working on energy concerns (Tables 3 and 4). Since not all of those surveyed responded to the question on major field and the question on occupation, and since the large or fractional weights used can result in small errors, the totals given by major field of study and by occupation are slightly different.

ENERGY SOURCE

; >

For the first time, energy-related respondents were asked to identify the energy source involved in the largest proportion of their energy-related work during the reference week. Tables 5 and 6 show that for both class years, the highest proportion of scientists and engineers listed petroleum as the major energy source, followed by nuclear sources. Of the 1972 graduates, a higher percentage of scientists (34.4 percent) than engineers (27.4 percent) were involved primarily in petroleum-related projects. In the 1976 sample, the same proportion of scientists as engineers worked on petroleum-related concerns (31 percent).

Tables 7 and 8 indicate that the distribution of work activities is similar for the fossil fuels (coal, petroleum, natural gas). Among 1972 graduates, a slightly higher proportion of those working on petroleum concerns are involved in development than are those working on coal or natural gas. The reverse is true of the proportion of petroleum-related workers in operations. Graduates of 1972 working with nuclear power are more likely to be involved in management activities than are their counterparts working with other energy areas. This is not the case for 1976 graduates.

ENERGY-RELATED ACTIVITY

Tables 9 and 10 indicate all energy-related activities in which the respondents were involved. Respondents were asked to check all activities in which they were involved, and the reader should note that in some cases, this involvement may be minor. Both engineers and scientists were involved in electric power generation, extraction, transportation, and environmental impact activities, though often more engineers than scientists worked in these areas. Engineers also indicated involvement in the manufacture, utilization, and conservation of energy. Scientists who graduated in 1976 also worked on energy utilization and conservation. More scientists than engineers participated in exploration activities (approximately 30 percent of scientists and 7 to 8 percent of engineers).

Tables 11 and 12 indicate the primary energy-related activities in which the respondents were engaged. Nearly 25 percent of the energy-related recent graduates were primarily involved with the extraction, manufacture, or processing of energy. Over 25 percent of the scientists were engaged in

6

exploration activities, and a noticeable proportion of engineers worked on generation of electricity. Between the 1972 and 1976 graduating classes, involvement in energy conservation increased, mainly due to the increased participation of scientists in this area.

Environmental impact work was listed as a primary activity by only a few respondents. This is not surprising when one remembers that "environmental protection" was also a choice as an area of national concern. As mentioned earlier, it is likely that many persons working on the environmental effects of energy use selected "environmental protection" rather than "energy and fuel" as their area of work.

As Tables 13 and 14 indicate, the highest proportion of persons involved in exploring for energy viewed the major portion of their work as applied research. Most energy-related activities involved the respondents in management, design, or operations activities. Those working on environmental impact reported their major work activities as report and technical writing, basic research, and either consulting (1972 graduates) or quality control (1976 graduates).

Further information on energy-related scientists and engineers can be found in Appendix A, Tables A-1 through A-28.

Due to the small number of respondents in each detailed category, and the large weights assigned to some respondents, the detailed figures in this table are less reliable than the aggregated figures used elsewhere in this report.

TOTAL POPULATION AND ENERGY-RELATED NEW ENTRANTS

MAJOR FIELD OF STUDY VERSUS OCCUPATION

As Table 15 illustrates, more engineers than scientists were employed in the same field as their college major. On the whole, energy-related scientists and engineers were more often employed in their major field than was the total population of science and engineering graduates. Differences between the total and energy-related populations were most pronounced among 1972 science graduates, and least pronounced among the 1976 engineering graduates. A more detailed comparison of major field of study and occupation for energy-related graduates can be found in Appendix A, Tables A-27 and A-28.

Table 16 compares college major with occupation for bachelor's and master's recipients. Predictably, scientists with master's degrees are more likely than those with bachelor's degrees to be employed in the field of their college major. However, engineers with master's degrees are only slightly more likely to hold engineering jobs than their bachelor's-level counterparts.

EDUCATIONAL ATTAINMENT BY MAJOR

Tables 17 and 18 show that energy-related scientists and engineers are more likely to have advanced degrees than the total group of respondents. Of the energy-related group, 47.3 percent held a master's or higher degree of the 1972 graduates, and 31.4 percent of the 1976 graduates. Of all the scientists and engineers surveyed, 41.9 percent held a master's or higher degree among 1972 graduates, and 25.1 percent of 1976 graduates held advanced degrees.

Energy-related scientists account for the major portion of this difference. Of all science majors who graduated in 1972, 29.8 percent earned master's or higher degrees, while this was true of 43.7 percent of the energy-related scientists. Of 1976 graduates, 19.2 percent of all science majors and 26.7 percent of energy-related science majors held degrees higher than a bachelor's. Predictably, a higher proportion of 1972 graduates than of 1976 graduates have earned advanced degrees.

EDUCATIONAL ATTAINMENT BY OCCUPATION

Differences in educational attainment are also evident between the energy-related and the total population of new entrants into the work force

when they are classified by occupation. On the whole, energy-related respondents seem slightly more likely to hold advanced degrees, especially those working as scientists (Tables 19 and 20).

RACE

Although the proportion of non-whites who majored in science and engineering increased from 5.1 percent of the 1972 graduates to 6.6 percent of the 1976 graduates, the proportion of non-whites who indicated that they were working on energy-related problems declined (Table 21). Engineers account for the majority of the fluctuation. Among those who graduated in 1972, 5.5 percent of all engineering graduates were non-white and 7.6 percent of energy-related engineering graduates were non-white. For the class of 1976, the respective figures were 7.6 percent and 4.4 percent.

By occupation, 5.5 percent of all employed 1972 scientists and engineers were non-white, as were 6.9 percent of the energy-related scientists and engineers. For 1976, 7.1 percent of the total, and 4.4 percent of the energy-related group were non-white. This suggests that non-whites are more likely to work in energy-related areas as they gain experience--especially non-white engineers.

SEX

A higher percentage of the graduates in science and engineering in 1976 (29.2 percent) were female than in 1972 (21.6 percent) (Table 22). The proportion of energy-related females also rose between 1972 and 1976. However, the representation of women in the energy-related group remained comparatively small (6.0 percent of 1972 graduates, and 13.5 percent of 1976 graduates). One finds similar results in the distribution of females by occupation. Although 14.5 percent of the class of 1972 scientists and engineers and 22.2 percent of the class of 1976 scientists and engineers were female, the figures for the energy-related group were 5.8 percent and 9.6 percent, respectively.

Most of this difference can be attributed to the small proportion of energy-related female scientists. Since 82 percent of all female scientists who graduated in 1972, and 85 percent of those who graduated in 1976 held degrees in either the life or social sciences, these results are reasonable. Few life or social scientists are involved in energy-related activities.

TYPE OF EMPLOYER

Most of the engineers and a sizable number of the scientists surveyed were employed by private industry. Among the energy-related, an even larger proportion of engineers (87.2 percent of 1972 graduates; 82.9 percent of 1976 graduates) and scientists (70.6 percent of 1972 graduates; 59.3 percent of 1976 graduates) worked for private industry (Tables 23 and 24). Educational institutions employed the second largest proportion of 1976 energy-related science and engineering graduates. Of the 1972 graduates, the second largest group of energy-related scientists worked in educational institutions, but more engineers were employed in the federal government than in education. Type of employer is shown separately for bachelor's and master's recipients in Appendix A, Tables A-29 and A-30.

PRIMARY WORK ACTIVITY

More of the energy-related scientists and engineers listed applied research, design, and operations as their primary work activity than the total population of scientists and engineers (Tables 25 and 26). These activities are common among engineers, who make up a much larger proportion of the energy-related group than of the total population. Slightly more of the energy-related scientists than total scientists indicated basic research as their primary work activity, and fewer energy-related than total scientists were involved in management or teaching activities. Energy-related engineers were as likely to be involved in management as all other engineers and less likely to be involved in development. Differences between energy-related and total engineers are less pronounced than between energy-related and total scientists.

Since the 1972 graduates have been in the work force longer than the 1976 graduates, one might expect to find a larger group of 1972 graduates in management positions
Tables 19 and 20 show this to be the case. Of all scientists and engineers who graduated in 1972, 16.9 percent and 17.7 percent of the energy-related responded that management was their primary work activity. Of the 1976 graduates, 11.0 percent and 11.8 percent of the total and energy-related groups were primarily involved in management. Tables A-31 through A-34 in Appendix A also show the predictable results that engineers with master's degrees are more likely than bachelor's-level graduates to hold management positions, and less likely to work in design,

quality control, or operations. Except for the energy-related 1972 graduates, master's-level scientists were no more likely than their bachelor's-level counterparts to hold management positions. Instead, more of the scientists with master's degrees were involved in teaching activities or research.

TYPE OF EMPLOYMENT

Tables 27 and 28 indicate the type of employment held by the energy-related and total employed respondents. Findings here support the results in Table 9—that the energy-related are much more likely than the total population of scientists and engineers to be employed in a field related to their college majors. Tables A-35 through A-38 in Appendix A show these results in more detail.

MEDIAN SALARY

For all scientists and engineers who graduated in 1972, the median annual salary was \$17,000 (Table 29), and for the 1976 graduates, \$12,500 (Table 30). Median annual salaries for energy-related scientists and engineers were 29 percent and 40 percent higher for 1972 and 1976 graduates, respectively. Energy-related engineers of both classes reported salaries 3 to 5 percent higher than all engineers, and energy-related scientists reported salaries approximately 25 percent higher than salaries for all scientists. Among the energy-related 1972 graduates, mechanical engineers and nuclear, petroleum, and mining engineers reported the highest salaries. Chemical, nuclear, petroleum, and mining engineers earned the highest salaries among 1976 graduates. Of the energy-related scientists, the environmental scientists reported the highest median salaries.

Of the 1972 science and engineering graduates, the largest differences between the energy-related and total populations are found between social scientists (a difference of 33 percent by both occupation and degree) and between environmental scientists (35 percent by college major, 15 percent by occupation). The same is true of 1976 science and engineering graduates. Energy-related environmental scientists reported median salaries 35 to 40 percent higher than the total population of environmental scientists who graduated in 1976. By occupation, energy-related social scientists earned 42 percent more than all social scientists of the 1976 class.

In contrast, energy-related electrical or electronic engineers of both classes reported median salaries the same or slightly lower than the salaries

reported by all electrical or electronic engineers. For the 1976 graduates, this applies also to mechanical engineers. Separate salary information for bachelor's and master's recipients is contained in Tables A-39 through A-42.

COMPARISON OF 1976 AND 1978 SURVEYS OF RECENT GRADUATES

In 1976, Westat conducted an earlier version of the 1978 survey just discussed. Though the sampling techniques used differed slightly between these two surveys, the 1976 graduates who responded to the 1978 National Survey of Recent Science and Engineering Graduates should be roughly comparable to the 1974-75 graduates sampled in the 1976 survey. Both groups were surveyed one or two years after graduation. Respondents to the 1978 survey who graduated in 1972 had been in the work force longer and accumulated more experience. (Approximately 65 percent of 1972 graduates reported five or more years of professional experience, while 65 percent of 1976 graduates reported less than three years experience.) Differences between the responses of 1976 and 1974-75 graduates should indicate differences in the opportunities for new scientists and engineers between 1976 and 1978. The 1972 graduates, when compared with the other two groups, should indicate how employment opportunities may change as the new scientists and engineers gain experience.

MAJOR FIELD AND OCCUPATION

Fewer of the 1974-75 graduates responded that their work was energy-related than did graduates of either 1972 or 1976 (Tables 31 and 32). This probably reflects increased national attention to energy issues between 1976 and 1978, when the surveys were taken. The attention may have increased opportunities in energy-related projects. Alternatively, it may mean that people in 1978 were more aware of the connections between their jobs and energy concerns than they were in 1976.

The 1976 survey indicated a strong demand for engineers; 81.1 percent of all engineering graduates surveyed in that year had found employment in engineering. An even higher proportion of the energy-related engineering graduates were employed as engineers (Table 33). Demand for science graduates was not as strong, and only 40.0 percent of the 1974-75 science graduates held jobs in science. However, 55.5 percent of the energy-related science graduates were employed as scientists.

The results from the 1978 survey of 1972 and 1976 graduates were strikingly similar. Of the 1972 engineering graduates, 76.2 percent of the total, and 89.6 percent of the energy-related were employed as engineers. Of the 1976 engineering graduates, 82.8 percent of the total, and 91.6 percent of the energy-related graduates were working as engineers. Among

the science graduates, 32.7 percent of the total population and 55.2 percent of the energy-related population worked in some branch of science. For 1976 science graduates, the respective figures were 37.6 percent and 53.1 percent.

EDUCATIONAL ATTAINMENT

Table 34 indicates educational attainment by major field of study for total and energy-related 1972 graduates. Tables 35 and 36 list the same information for 1974-75 and 1976 graduates, respectively. In Tables 37, 38 and 39, information is given on educational attainment by occupation for each respective class. By major field of study, the pattern of educational attainment, both for the energy-related and for the total number of scientists and engineers, changed little between the 1974-75 and 1976 graduates (Tables 35 and 36). For both years, the level of educational attainment among engineers was not significantly different between total and energy-related groups. Energy-related science majors were still more likely than all scientists of the same class year to hold advanced degrees. However, the proportion of energy-related science majors with a master's degree or higher declined from 34.0 percent among 1974-75 graduates to 26.7 percent among 1976 graduates, while nearly the same percentage of all science majors earned higher degrees. Occupationally, the same relative number of energy-related scientists held advanced degrees of the 1976 and 1974-75 graduates (Tables 38 and 39). But the percentage of all scientists with degrees above the bachelor's level increased in 1976 and approached the proportion of energy-related scientists with advanced degrees.

Graduates of 1972 have had more time in which to earn additional degrees, and have used the opportunity (Tables 34 and 37). Approximately 40 percent of 1972 engineering majors (total and energy-related) held master's degrees or higher, as opposed to 31 percent to 35 percent (Tables 36 and 37) among the later graduates. Of all 1972 science majors, 29.8 percent held advanced degrees, as well as 43.7 percent of the energy-related science majors. By occupation, an even higher proportion of 1972 scientists held degrees beyond the bachelor's: 59.6 percent of the total, and 59.6 percent of the energy-related.

RACE

In all categories, the percentage of non-white scientists and engineers increased in the 1976 class over the percentages for the two earlier classes (Table 40). For the total sample, the increase was most noticeable among engineering majors. The changes in the proportion of non-white energy-related scientists and engineers are somewhat puzzling. It may be helpful here to consider that the 1972 and 1976 graduates were surveyed in 1978, while the 1974-75 graduates were surveyed in 1976. The larger sample size, and larger number of energy-related respondents in the 1978 survey than in the earlier survey, could account for this difference. Alternatively, Table 34 may indicate that non-whites with a recent degree in science or engineering were more likely in 1978 than in 1976 to be employed in energy-related projects. Figures for 1972 graduates might indicate further that more experienced non-whites are even more likely than recent graduates to work on energy problems.

The apparent increase in energy-related non-whites between the 1976 and 1978 surveys may also reflect the way people view their jobs. As discussed earlier, people may have been more likely to consider themselves energy-related in 1978 than in 1976 due to increased national awareness of energy problems. If such a change in perceptions has occurred, the difference in the proportion of energy-related non-whites between the 1976 and 1978 surveys may not be as large as it appears.

SEX

From 21.6 percent in 1972, the proportion of women graduating in science and engineering increased to 29.2 percent of the 1976 class (Table 41). However, nearly all of these women majored in science. The percentage of female engineers (though small) was roughly the same or higher for energy-related graduates than for all graduates in each survey group. But a smaller proportion of women scientists were represented in the energy-related group than in the total number of scientists. This may be explained by the fact that 85 percent of all female scientists in the class of 1976, and 82 percent of the female scientists in the class of 1972 held degrees in life or social sciences. Only a small proportion of graduates in these fields are involved with energy problems (Table 31).

TYPE OF EMPLOYER

Private industry consistently employed the majority of scientists and engineers in all three groups surveyed (Tables 42 through 44). In all groups an even larger proportion of energy-related than total respondents worked for private industry. The difference between energy-related and total scientists was the most dramatic: the 60-70 percent of energy-related scientists in private industry was nearly double the proportion of all scientists working for private firms. Educational institutions employed a larger proportion of all scientists than of energy-related scientists, especially among 1972 graduates, and a much higher percentage of scientists than of engineers.

PRIMARY WORK ACTIVITY

In general, energy-related respondents, especially engineers, were more likely than all respondents to be involved in applied research, design, and operations (Tables 45 through 47). Energy-related scientists were less likely to be involved in teaching activities than all other scientists. Among 1972 and 1976 graduates, all scientists were less likely than energy-related scientists to be active in basic research. Engineers who graduated in 1972 were much more likely than engineers from later classes to hold management positions. This was not true for the corresponding group of scientists.

COMPARISON OF RECENT GRADUATES WITH THE EXPERIENCED WORK FORCE

The 1976 National Survey of Natural and Social Scientists and Engineers, conducted for NSF by the Bureau of Census, sampled individuals who were identified as scientists or engineers in the 1970 Census of Population. Since they were in the work force in 1970, these individuals generally were older and had more experience than those in the Westat surveys (discussed earlier), who received their degrees in 1972 or later. The Census survey contained some questions comparable to questions asked in each of the Westat surveys. However, the wording of questions used in the Census survey differed somewhat from questions in the Westat surveys and only rough comparisons can be made. In addition, one must use care in comparing results from the 1978 Westat survey (of 1972 and 1976 graduates) with results from the survey of experienced workers conducted two years earlier, since answers given to a survey in 1978 might have been different than those recorded in 1976. The methods used to classify respondents as scientists or engineers also differed between the Census and Westat surveys.

The Westat samples were drawn from persons who received degrees in a science or engineering field. The Census sample included only persons who met a set of multiple criteria, including field of degree, occupation, and self-identification. As a result, many individuals may have been excluded from the Census survey who would have been included under the Westat criteria. MAJOR FIELD AND OCCUPATION

As shown in Table 48, recent⁶ engineering graduates seem more likely than experienced engineering majors to be involved in energy-related activities. Differences are largest among civil and mechanical engineers, and appear to have increased between the 1976 and 1978 surveys. However, the difference may be overstated, since the data on experienced workers are for 1976 only. The proportion of energy-related experienced engineers may also have increased in those two years.

In the 1976 surveys, the percentage of new scientists whose work involved energy (3.4 percent) was smaller than the proportion of experienced energy-related scientists (8.9 percent in 1976). In 1978, the energy-related comprised up to 7.3 percent of recent graduates working as scientists, much closer to the proportion of energy-related experienced scientists reported

two years earlier. Both new physical scientists and new environmental scientists were more involved in energy-related activities at the time of the 1978 survey than recent graduates had been two years earlier. However, the percentage of experienced environmental scientists working on energy concerns (48.9 in 1976) remained higher than the percentage of recent graduates in this category (33-34 percent).

Although the energy-related proportion of all new scientists and engineers increased from 4.6 percent of 1974-75 graduates to 8.3 percent of 1976 graduates, it remained below the 12.0 percent of experienced scientists and engineers who were energy-related. This can be at least partly explained by the large proportion of engineers (approximately 65 percent) in the experienced work force, and the small proportion of engineers among recent graduates (20 percent or less). As discussed earlier, engineers are more likely than scientists to work on energy problems.

Due to the differences in classification systems between the survey of experienced scientists and engineers and the surveys of recent graduates, comparisons must be made cautiously. Table 49 indicates that experienced science majors were more likely than recent graduates to be working as scientists. For engineering majors, the table suggests that experienced workers are less likely than recent graduates to be employed as engineers. However, the proportion of experienced workers whose work involves engineering is probably understated. In this table, a person who indicated "administration or management" as his or her occupation was not considered to be employed in either science or engineering, even if that person managed a science or engineering project. Since experienced workers are more likely than recent graduates to have indicated "administration or management" as an occupation, the proportion of experienced workers employed in science or engineering is more likely to be understated.

SEX AND RACE

According to the 1976 survey, non-whites comprised a smaller proportion of those working as scientists and engineers who graduated in 1974-75 (2.2 percent) than of experienced scientists and engineers (3.3 percent) (Table 50). In 1978, the proportion of non-white scientists and engineers had increased to 6.9 percent of 1972 graduates and 4.4 percent of 1976 graduates, indicating that non-white participation in energy-related activities increased between 1976 and 1978.

The proportion of females among all recent graduates was higher than the 1.0 percent among experienced workers (Table 51). This was especially true of 1976 graduates by occupation (9.6 percent female).

TYPE OF EMPLOYER

Table 52 compares energy-related recent graduates with energy-related experienced workers by type of employer. Recent graduates are more likely than experienced workers to be employed in educational institutions, but otherwise the two groups are similar. Six years after graduation, the pattern of 1972 engineers resembles that of the experienced engineers.

PRIMARY WORK ACTIVITY

Management and consulting activities are, predictably, more common to experier—workers than to recent graduates (Tables 53 through 55). However, engineers who graduated in 1972 are more likely than later graduates (though still less likely than experienced workers) to be involved in management. New engineers are more likely than experienced ones to work on applied research, quality control and operations. A higher percentage of new than experienced scientists are active in basic research, and a larger proportion of 1974 and later graduates seem to be working in applied research than of their more experienced counterparts.

APPENDIX B - QUESTIONNAIRE USED IN 1978 NATIONAL SURVEY OF RECENT SCIENCE AND ENGINEERING GRADUATES

NATIONAL SCIENCE FOUNDATION WASHINGTON, D.C. 20550

Dear Graduate:

We need your help in a major national study of the occupational experiences of recent graduates in Science and Engineering. This project, sponsored by the National Science Foundation and the U.S. Department of Energy, will obtain information from a scientifically chosen sample of 13,000 persons who earned Bachelor's or Master's degrees between July 1, 1975 and June 30, 1976. The sample consists of graduates in engineering and natural, physical, or social science. You are one of those chosen to be in this study.

The purpose of this study is to compile national statistics which will allow an appraisal of the employment and educational characteristics of scientists and engineers 9-aduating in 1975/76.

The resulting information will permit the Federal Government, universities and others to formulate science policies and programs and to make evaluations with regard to the science and engineering manpower potential of the nation.

The questionnaire on the following pages will take about 10-15 minutes of your time to complete, and a postage-paid envelope addressed to Westat, Inc. is enclosed for its return. Westat, Inc. has been selected by the National Science Foundation to assist in carrying out this survey.

We wish you to know that your completed questionnaire will be seen only by the immediate research staff and will be used for statistical purposes only. In compliance with the Privacy Act of 1974, no personally identifying information will be released to anyone.

We think you will find it interesting and invite your comments on the questionnaire items. In addition, if you have any questions on the survey or need any assistance in completing the questionnaire, please call (collect) Mr. Mark Waksberg or Mr. George K. Schueller at (301) 881-5310.

It would be of great help if you would complete and return the questionnaire within the next five days. If possible, we suggest that you do it now, while you have it in hand. We believe the importance of the study will justify the time you give to it.

The National Science Foundation and the U.S. Department of Energy would greatly appreciate your cooperation in this survey.

Very truly yours,

Charles E. Falk, Director Division of Science Resources Studies

This information is solicited under the authority of the National Science Foundation Act of 1950, as amended. All information you provide will be treated as confidential and will be used for statistical purposes only. Information will be released only in the form of statistical summaries from which it will be impossible to identify information about any particular person. Your response is entirely voluntary and your failure to provide some or all of the requested information will in no way adversely affect you.

NATIONAL SCIENCE FOUNDATION

WASHINGTON, D.C. 20550

Dear Graduate:

We need your help in a major national study of the occupational experiences of recent college graduates in Science and Engineering. This project, sponsored by the National Science Foundation will obtain information from a scientifically chosen sample of 16,000 persons who earned Bachelor's or Master's degrees between July 1, 1973 and June 30, 1975. You are one of those chosen to be in this study.

The purpose of this study is to compile national statistics which will allow an appraisal of the employment and educational characteristics of scientists and engineers graduating since 1973. The resulting information will permit the Federal Government, universities and others to formulate science policies and programs and to make evaluations with regard to the science and engineering manpower potential of the nation.

The questionnaire on the following pages will take about 10-15 minutes of your time to complete, and a postage-paid envelope addressed to Westat, Inc. is enclosed for its return. Westat, Inc. has been selected by the National Science Foundation to assist in carrying out this survey.

We wish you to know that your completed questionnaire will be seen only by the immediate research staff and will be used for statistical purposes only. In compliance with the Privacy Act of 1974, no personally identifying information will be released to anyone.

We think you will find it interesting and invite your comments on the questionnaire items. In addition, if you have any questions on the survey or need any assistance in completing the questionnaire, please call (collect) Mr. Mark Waksberg or Mr. George K. Schueller at (301) 881-5310.

It would be of great help if you would complete and return the questionnaire within the next five days. If possible, we suggest that you do it now, while you have it in hand. We believe the importance of the study will justify the time you give to it.

The National Science Foundation would greatly appreciate your cooperation in this survey.

Very truly yours,

Charles E. Falk, Director

Division of Science Resources Studies

This information is solicited under the authority of the Nationa' Science Foundation Act of 1950, as amended. All information you provide will be treated as confidential and will be used for statistical purposes only. Information will be released only in the form of statistical summaries from which it will be impossible to identify information about any particular person. Your response is entirely voluntary and your failure to provide some or all of the requested information will in no way adversely affect you.

Dear Friend: Thank you for your continued cooperation in the National Sample of Scientists and Engineers, a sarias of biennial surveys sponsored by the National Science Foundation and conducted by the Bureau of the Cansus. From this series, a comprehensive picture of the devalopment and utilization of America's scientists and engineers is being obtained. And, since the surveys inclinde a sample of persons from various other fields, in addition to science and engineering, a valuable measure of the employment and skills among the highly educated population in general has been gained. Statistical data from these surveys are used for planning and analysis by Feueral and State manpower agencies, private businesses, nonprofit research organizations, industrial and trade associations, and universities. Your cooperation, of course, has been an essential element in the success of this program. To extend the value of past surveys, the National Science Foundation has asked the Bureau to survey this sample of persons once again to collect current employment information and related data. This is the most reliable and least costly way to learn, for example, how the employment of highly trained persons is affected by fluctuations in the economy. For the survey to be successful and yield truly representative information, it is important that each person fill out and return the questionnaira. Please complete the questions which follow on pages 2 through 4 and return your questionnaire in the enclosed preaddressed envelope. For some questions you are instructed to enter a code and description from Reference List A, B, or C. These lists are attached to the questionnaire. This information is being collected under the authority of the National Science Foundation Act of 1950, as amended. The information you provide is confidential and may be seen only by sworn employees of the Bureau of the Census. The information cannot be used for anything but statistical

MERINGE LIST A - MAJOR FIELDS OF STUDY

This list is to be used in enswering question to about the field(s) in which you have obtained study or training, it is divided into two sections: Section i is a list of fields of study and training below those generally leading to bachelor's or higher degrees; Section II is a list of fields of study and training below those generally leading to a bachelor's degree,

Please scan the entire list, choose the appropriate answer for the question and then enter the code and description in the appropriate section of question 1b. If none of the estepones listed below adequately describes what you were studying or being trained in, use the "Other" category (code 600 or 625) and enter a brief description of what you were studying in the space provided on the questionnaire.

Section I - FIELDS OF ACADEMIC STUDY LEADING TO BACHELOR'S OR HIGHER DEGREES

614	Forestry	- 1	
625	Other science-related fields of study or training	1	

REFERENCE LIST B - KINDS OF BUSINESSES

.. :---

This list is to be used in answering question 7 about the kind(s) of business or industry for which you worked. Please scan the entire list, choose the appropriate answer for the question and entire the code and description from this list. If none of the categories is taked below adequately describes the kind of business to when you worked, use the "Other" caugiory code 731.

Code	Description	Code	Description
	Manufacturing		Other Kinds of Business
781 782 783	Aircraft, aircraft engines, aircraft parts Chemicals and allied Products Electrical machinery, equipment and supplies for the generation, storage, transformation, transmission, and utilization of electrical energy	720 721 722 723 724	Agriculture, forestry, and fisheries Business, personal, and professional services Construction Engineering or architectural services Finance, insurance, or real estate
784	Electronic apparatus, radio, television and communication equipment and parts	725 726	Mining and petioleum extraction Private, nonprofit organizations other than
705	Electronic computers, accounting, calculating and office machinery and equipment	727	educational institutions and hospitals Professional and technical societies
706	Fabricated metal products (except ordnance, machinery and transportation equipment)	728 729 730	Research institutions Retail and wholasale trade
707	Machinety (except electrical) including engines and luibles, farming and construction machinery, mining, metalworking and other manufacturing and service industry machines	731	Transportation, communication, or other public utilities Other (Describe briefly under the applicable item on the questionnaire.)
708	Motor vehicles and motor vehicle equipment including trucks, buses, automobites, railroad engines and cars		
709	Ordnance, including manufacture of arms, ammunition, tanks, and complete guided missiles, space vehicles and equipment		Public Administration (include only uniquely governmental activities, such as the U.S. Postal Service, U.S. Air
710 711	Petioleum relining and related industries Primary metal industries, including smelting, refining, rolling, drawing, alloying, and manufacture of castings, foreings and other basic metal products		Force. State court. Department of Motor Vehicles. city building inspection, or city public welfare. For example, if you work for the U.S. Postal Service use code 733, Federal public administration; on the other hand, if you
712 713	Professional and scientific equipment and supplies Other manufacturing including printing and publishing		work at a Veterans' Administration Hospital, use code 718. Hospital or clinic; if you work at a State university, use code 714. College or university; if you work for a county
İ	Educational Institutions		road building agency, use code 722. Construction, if you
714 715 716	College or university (offering at least a bachelor's degree) Junior college or technical institute Medical school		work in a Defense Department research laboratory, use code 728, Research institution.)
717	Other educational institutions	732 733 734	Uniformed military service Federal public administration State public administration
l	Health Services	735	Local Public administration (city, county, etc.)
718 719	Hospital or clinic Other medical and health services	737 736	Regional government Other government

REFERENCE LIST C - OCCUPATIONS

This list is to be used in answering questions 8 and 19 about your occupational classification. Please scan the entire list, choose the appropriate entity and enter the code and description from this list, if you cannot find exactly the right entity, please choose the one that comes nearest to it. If none of the entires is at all appropriate, use the "Other" category (code 475) and enter a brief description in the space provided on the questionnaire.

Code	Description	Code	Description
	Engineers, including college Professors and instructors		Health Occupations, including persons who are primarily
401	Engineer, acronautical and astronautical		practitioners. Persons engaged primarily in medical
402	Engineer, agricultural	ļ	research, teaching, and similar activities use code 432. Medical scientist.
403	Engineer, chemical	į .	
404	Engineer, civil and architectural	438	Physician oi surgeon
